Dear Ulrike Weiss:

Thank you for the opportunity to trial the MOTomed VIVA I and VIVA II machines in our facility. We have been using the machines for a total of 6 months at Magee Riverfront, an outpatient physical rehabilitation facility. We have used the MOTomed on a variety of clients including those with spinal cord injury, MS, TBI, stroke, and other neurological and orthopedic diagnoses.

We have found the MOTomed to be especially beneficial for clients with moderate to severe spasticity. The MOTomed has improved their range of motion and assisted with reduction of spasticity. We have also used it to improve endurance with low level clients and improve strength. The ease of getting clients in and out of the machine makes it a first choice of equipment to use with clients who have limited active motion. The active assisted mode allows the clients to feel that they are able to at least somewhat participate in a strengthening program, and they are able to rest and go into passive mode when they fatigue.

We have also received feedback that the MOTomed is very easy to use and easy to train caregivers to set up.

Thank you again for the opportunity. We look forward to purchasing a unit for the facility as the budget allows.

Sincerely,

Carol I. Owens, PT, GCS
Riverfront Rehab Supervisor
